numerical models of flow and transport processes are heavily employed in the fields of surface soil and groundwater hydrology they are used to interpret field observations analyze complex and coupled processes or to support decision making related to large societal issues such as the water energy nexus or sustainable water management and food production parameter estimation and uncertainty quantification are two key features of modern science based predictions when applied to water resources these tasks must cope with many degrees of freedom and large datasets both are challenging and require novel theoretical and computational approaches to handle complex models with large number of unknown parameters

the multi volume set Incs 15623 until Incs 15646 constitutes the proceedings of the workshops that were held in conjunction with the 18th european conference on computer vision eccv 2024 which took place in milan italy during september 29 october 4 2024 these Incs volumes contain 574 accepted papers from 53 of the 73 workshops the list of workshops and distribution of the workshop papers in the Incs volumes can be found in the preface that is freely accessible online

this book focuses on the application of geospatial technologies for resource planning and

management for the key natural resources e.g. water, agriculture and forest as well as the decision support system (DSS) for infrastructure development. We have seen in the past four decades that the growing complexities of sustainable management of natural resources management have been very challenging. The book has been written to leverage the current geospatial technologies that integrate the remotely sensed data available from various platforms, the precise locational data providing geospatial intelligence and the advanced integration tools of geographical information systems (GIS). Geospatial technologies have been used for water resources management employing geomorphological characteristics analysis of river migration pattern, understanding the large scale hydrological process, wet land classification and monitoring, analysis of glacial lake outburst flood (GLOF) assessment of environmental flow and soil erosion studies, water quality modelling and assessment and rejuvenation of paleochannels through groundwater recharge. Geospatial technologies have been applied for crop classification and mapping, soil moisture determination using RISAT-1 C band and PALSAR-2 L band sensors, inventory of horticulture plantations, management of citrus orchards, crop yield forecasting, rice yield estimation, estimation of evapotranspiration and its evaluation against lysimeter and satellite based evapotranspiration product for India to address the various issues of the agricultural system management. Geospatial technologies have been used for generation of digital elevation model, urban dynamics assessment, mobile GIS application at grass root level, planning, cadastral level developmental planning and e-governance applications, system dynamics for sustainable development, micro level water resources planning, site suitability for sewage treatment plant, traffic density assessment, geographical indications of India, archaeological applications and disasters interventions to elaborate various issues of DSS for infrastructure development and management. Geospatial technologies have been employed for the generation and reconciliation of the notified forest land boundaries and also the land cover changes analysis within notified forest areas, forest resource assessment, management and monitoring and wildlife conservation and management. This book aims to present high quality technical case studies representing the recent developments in the application of geospatial technologies for resource planning and management. The editors hope that this book will serve as a valuable resource for scientists and researchers to plan and manage land and water resources sustainably.
